                 wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stenosis, such as collateral circulation in tissue infarction or arterial stenosis, such as of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in the intestinal tract. Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in viscular permeability. The products can also be used

Sequence 25, Application US/09761636A

Patent No. US20020065218A1

GENERAL INFORMATION:

APPLICANT: ACHEN, Marc

APPLICANT: STACKER, Steven

APPLICANT: CENDROW, Angela

TILLE OF INVENTION: VEGF-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFREENCE: 1064/48505 Achen et al

CURRENT APPLICATION NUMBER: US/09/761,636A

CURRENT FILING DATE: 2001-01-18

PRIOR FILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 34

SOFTWARE: PatentIn version 3.0
APPLICANT: ATHEN, MAIC
APPLICANT: STACKER, Steven
APPLICANT: HUGHES, Richard
APPLICANT: HUGHES, Richard
APPLICANT: ERDNROW, Angela
TITLE OF INVENTION: VEGF-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

Sequence 1. Application US/09219345A

Patent No. US2002017222A1

Patent No. US2002017222A1

GENERAL INFORMATION:

APPLICANT: ACHEN, Marc

TITLE OF INVENTION: EXPRESSION VECTORS AND CELL LINES EXPRESSING VASCULAR

TITLE OF INVENTION: MALANOMAS

TITLE OF INVENTION: MALANOMAS

TITLE OF INVENTION: MALANOMAS

TITLE OF INVENTION: MALANOMAS

TITLE OF INVENTION: MALANOMAS

TITLE OF INVENTION: MALANOMAS

TITLE OF INVENTION: MALANOMAS

FILE REFERENCE: 106444385 Marc ACHEN

CURRENT TRING DATE: 1098-12-23

PRIOR FILING DATE: 1998-12-24

PRIOR FILING DATE: 1998-05-29

Patent No. 6541008
GENERAL INFORMATION:
APPLICANT Wise, Lyn M
APPLICANT: Marcer, Andrew A
APPLICANT: Savory, Loreen J
APPLICANT: Stacker, Stephen B
APPLICANT: Stacker, Stephen B
TITLE OF INVENTION: VASCULAR ENOTHELIAL GROWTH FACTOR-LIKE PROTEIN FROM ORF
TITLE OF INVENTION: VIRUS NZ2 BINDS AND ACTIVATES MAMMALIAN VEGF
TITLE OF INVENTION: RECEPTOR-2, AND USES THEREOF
FILE REFERENCE: Sequence Listing for 09/431,833
PATENT NO. 6541008
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 6, Application US/09847524

Patent No. 6689352
GENERAL INFORMATION:
APPLICANT: ACHEN, Marc G
APPLICANT: STACKER, Steven A
TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL
TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL
TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL
TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL
TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL
CURRENT APPLICATION NUMBER: US/09/847,524
CURRENT FILING DATE: 2001-05-03
NUMBER OF SEQ ID NOS: 6
SOFTWARE: PATENTIN VET. 2.0
SEQ ID NO 6
LENGTH: 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     APPLICANT: STACKER, Steve A.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

"Empirical analysis of transcriptional activity in the Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IsoId=Q8RXR2-2; Sequence=VSP_009325;
Note=May be due to a competing acceptor splice site. No experimental confirmation available;
-!- SIMILARITY: Belongs to the chloride channel (TC 1.A.11) family.
-!- SIMILARITY: Contains 2 CBS domains.
-!- CAUTION: Ref.3 sequence differs from that shown due to erroneous gene model prediction.

```
Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VBGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet a carbon separation distances on opposite antiparallel strands of a

useful for producing antibodies capable of binding to these 2

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides (comprising 2 linked menocyclic peptides) and a cyclic peptides (comprising 2 linked menocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

Coharacterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or crauma, substance-induced neovascularisation of the liver excessive trauma, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vesels and lymphatic or brain. The peptides are used to image blood vesels and lymphatic with at least one biological activity induced by WEGF. VEGF-C or -D and are also used in combination with an unit, inflammatory agent, to treat a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
         polypeptides. Polymucleotide sequence encoding the polypeptides of the invention are useful in the identification and purification of their native ligands, and as molecular markers of the tissues in which they are expressed. They provide valuable sequence motifs, which can be inserted or substituted into other native members of the endocytic type C lectins, and provide hybridisation probes for searching cDNA and genomic libraries for the coding sequence of other type C lectins. Variants of type C lectins may be used therapeutically as competitive inhibitors of the biological activity of native type C lectins. The present sequence represents a murine phospholipase A2 receptor protein which is homologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful for

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used a diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISh; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bhatia A;

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

cucoding a Propionibacterium acnes protein. The invention also relates to polymebrides encoded by the polymucleotides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a colymediachedide of the invention, antibodies against polymeptides of the invention, a comprising a polymeptide of the invention, a comprising a polymeptide of the invention, a comprising a polymeptide of the invention, a this method for stimulating an immune response specific for a P. acnes polymeptide of the invention, a colymeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polymeptides, polymerted, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymeptide, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the corypeptides are useful for diagnosing, preventing or treating acne polymeptides are useful for diagnosing, preventing or treating acne polymeptides can also be used as probes or primers for uncleic acid hybridisation. The polymucleotides can also be used as probes or primers for stimulation of an immune response against P, acnes, or for treating acne and the kit is useful for performing a diagnostic assay. The present cand hybridisation. The vaccine composition is useful for the stimulation of an immune response against P, acnes, or for treating account the kit is useful for performing a diagnostic assay. The present cand hybridisation, but was obtained in electronic format directly from Wilpo at firm while himself patent and necessary and the printed specification, but was obtained in electronic format directly from Wilpo at firm while the polymedian and patent and the printed specification, but was obtained in electronic format directly from Wilpo at firm while the polymedian and the polymedia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Maisonneuve JL;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in polypeptides. The proteins and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, bustulosis, hypertosis and osteonylitis), uveitis and endophthalmitis. Pracues is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The olypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies pecific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by carrayme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

cenceding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a comprising a polypeptide of the invention; an expension proteins comprising a polypeptide of the invention; an encode of the invention; an encode of the invention; an encode of constitution; fusion proteins composition (comprising T cells prepared to polypeptide and an isolated T cell population comprising T cells prepared to polymeria method a vaccine composition (comprising T cells prepared to polymeria method and the texpress the polypeptide); a method and kit can igen-presenting cells that express the polypeptide); a method and kit confident. The P. acnes polypeptides, polymerial of P. acnes in a content of a method for inhibiting the development of P. acnes in a content of P. acnes polypeptides, polymerial or the express the polymerial or diagnosing, preventing or treating acne proteins, T cell populations or antigen-presenting cells that express the polymeptides are useful for diagnosing, preventing or treating acne, protein. The polymucleotides can also be used as probes or primers for confident of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present confidence represents a polypeptide predicted to be enroaded by an ORF (open confidence represents a polypeptide predicted to be enroaded by an ORF (open confidence represents a polypeptide predicted to be enroaded by an ORF (open conding frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form at directly but was obtained in electronic format directly
                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä

                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to promoter. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant transformed plant having an improved property comprises transforming a plant with the aving an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or

The disorders include SARNO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies
content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the princed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABMM3624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; antibodies against polypeptides of the invention; antibodies specific for a P. acnes polypeptide and an isolated T cell population comprising T ealls prepared polymetric and an isolated T cell population comprising P. acnes polypeptides, polymetric and an isolated function (comprising P. acnes polypeptides, at this method; a vaccine composition (comprising P. acnes polypeptides, polymetricals, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion
                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
            downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (BLISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific or a P. acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polypeptide of human protein phosphatase 13.31 and its associated polynucleotide. The sequences are used in diagnosis and treatment of malignant tumour, embryonic developmental abnormality and autoimmune disease and for studying human antisenescence. This sequence represents human protein phosphatase 13.31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; protein phosphatase 13.31; enzyme; malignant tumour; cancer; embryonic developmental abnormality; autoimmune disease; antisenescence; gynaecological; cytostatic; immunosuppressant; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human protein phosphatase 13.31 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, autoimmune disease and embryonic development abnormality.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG00011. The represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                               Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      76.0%; Score 38; DB 4; Length 225; 66.7%; Pred. AAF81714 to AAF81740 encode the human proteases and protease inhibitors

(PPIMS) given in AAB74668 to AAB74694. The PPIMS can have activities such
as: anti-human immunodeficiency virus (IHIV); antidiabetic; antithyroid;
immunostimulant; immunodeficiency virus (IHIV); antidiabetic; antithyroid;
immunostimulant; immunodeficiency intifilammatory; immunosuppressive;
crephrotropic; antigout; thyromimetic; ortostatic; antibacterial;
crephrotropic; antisportatic; and hepatotropic. PPIM polymucleotide and
protein sequences can be used in the diagnosis, treatment and prevention
of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome,
crevere combined immunodeficiency disease (SCID), Chediak-Higashi
syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis,
crohn's disease, diabetes mellitus, Good pasture's syndrome, werner,
crohn's diseases, Hashimoto's thyroiditis, Sjogren's syndrome, Werner's
syndrome, viral, bacterial, fungal, parasitic, protozoal, and helminthic
infections and cell proliferative disorder such as arteriossicators,
atherosclerosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM
colymucleotide sequences can be used in somatic or germline gene therapy
and in diagnosis of diseases. They can also be used in generating
chybridisation probes useful in mapping the naurally occurring genomic
sequences and in molecular biology techniques
                                                                                                                                                                                Human; protease; protease inhibitor; protease and protease inhibitor; antidiabetic; inmunostication; diagnosis; anti-human immunodeficiency virus; HIV; antidiabetic; immunostication; antidiabetic; immunostication; antidiated thyroid; immunosupiessive; nephrotropic; antidout; thyromimetic; cytostatic; antibacterial; fungicide; protozoacide; antiarteriosclerotic; antiatherosclerotic; antipsoriatic; virucide; hepstotropic; gene therapy; autoimmune disorder; inflammatory disorder; AIDS; DiGeorge's syndrome; severe combined immunoficiency disease; SCID; Chediak-Higashi syndrome; Cushing's disease; Addison's disease; autoimmune thyroiditis; gout; Crohn's disease; diabetee mellitus; Good pasture's syndrome; infection; Grave's diseases; Hashimoto's thyroiditis; Sjogran's syndrome; cancer; Werner's syndrome; cell proliferative disorder; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New protease (inhibitors) useful for diagnosis and treatment of autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome, Cushing's disease, Addison's disease and cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lu DAM;

AAE01850-AAE01860 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 28 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative

```

```
The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, dispstive disorders (e.g. acquired disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), heamatopoietic disorders, neural disorders (e.g. Alzheimer's, heamatopoietic alsorders, neural disorders (e.g. Alzheimer's, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
